

# Series 18VRG Guitar Potentiometer Push-Pull Switch

CTS has an established track record of supporting the Pro Audio industry for many years and is continuing this support with the release of the Series 18VRG guitar potentiometer with push-pull switch.

This potentiometer provides guitarists with 15,000 cycles of rotational life and 10,000 cycles of switch life. Available in short bushings for standard pick guard mounting or long bushings for through body mounting, the 18VRG delivers superb signal-to-noise ratio.

The push-pull switch provides guitarists with a multifunction control that can activate/deactivate pickups, engage split-coil pickups, or change phase on pickups, all providing a variety of tonal characteristics from a single control. A variety of standard resistance values and tapers are also available. CTS is committed to provide guitarists with reliable volume and tone controls of the highest quality. Our Series 450 and 495 guitar potentiometers continue to set the standard in the guitar industry.
